

RIOT OS @ T2TRG

Martine Lenders (mlenders@riot-os.org)

24.09.2017

1. IEEE 802.15.4 Compliance
2. 6Lo-ND (RFC 6775)

1. IEEE 802.15.4 Compliance

2. 6Lo-ND (RFC 6775)

- Background: discussion on IEEE 802.15.4 compliance started 2017-09-17 on devel mailing list¹
- RIOT currently supports: Beacon, Data and ACK frames
 - IEEE802.15.4-2015: **reduced support** requires also “certain command frames” (channel scan, assoc. with coordinator)
- Current state of discussion: we want it, but optional

¹ <https://lists.riot-os.org/pipermail/devel/2017-September/005335.html>

1. IEEE 802.15.4 Compliance

2. 6Lo-ND (RFC 6775)

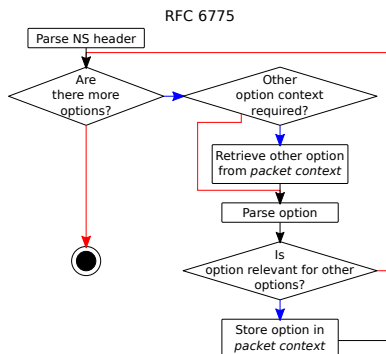

- Starting point (from an engineering perspective):
 - RIOT wants support more than just IEEE 802.15.4 (or other 6lo-featured link layers), e.g. Ethernet
 - RIOTers hate code duplication

⇒ RFC 6775 code is mixed with RFC 4861 code

- Other discussions:
 - Do we need NDP if we have (a slightly modified) RPL + assume reverse EUI-64 discussion?
 - Which device type is more prevalent in a typical 6LoWPAN? 6LR or non-routing 6LN?

6Lo-ND's Complexity

- NDP itself already complex (encompasses address resolution, router discovery, stateless address configuration, ...)
- Main problem with 6Lo-ND: Lot's of options depend on each other (e.g. ARO + SLLAO, ABRO + PIO + 6CO)

Is 6775-bis any better?

- EARO still dependent on SLLAO (won't change) in link-local NS
- RS/RA-behavior not defined (beyond 6CIO)
 - (use RPL? But then: where do compression contexts come from)
- RFC-6775-compliant implementation still required
